

## Backside Alignment 6" Kit

For Micralign™

For the first time, Micralign™ users can get their system upgraded with this BSA Upgrade Kit to perform backside alignment processes; it can also be used as a standard machine, handling all current processes with no changes to specifications. This eliminates the need for dedicated litho tools for backside alignment process.

Some of the *new* features in software include:

- Process selectable function for Backside Alignment or Normal wafer processing
- Process Control setting for illumination of the Backside Alignment Cameras
- Standard Process Offset capabilities to correct for registration errors

If you have BSA processes and are interested in upgrading your Micralign™, please contact us for more information.

Micralign™ is a trademark of ASML
